### Bio-friendly Organic Odour Eliminator Chases Raccoons Away

The City of Toronto has officially waged a war against the havoc caused by the raccoon population in the greater GTA area. Not only are these critters a nuisance to those individuals participating in organic waste programs, but the immense health implications involving the contact with raccoons can range from problems relating to ring worm, multi organ shutdown and in extreme cases even death. Toronto council members have voted in favour of moving forward with the implementation of a new green bin program with a price tag of 31 million dollars according to a report presented by the Public Works Committee. Green Leaf Distribution Inc. is an innovative company based in Collingwood Ontario that takes pride in creating solutions to tomorrow's environmental issues. They have recently reformulated their proven effective Green Bin Deodorizer with an added ingredient that deters animals of all kinds including raccoons. The new product is designed for use in the treatment of both waste and organic streams.

As organics and recycling programs become more widespread, a growing number of people are recognizing the importance of diverting food and yard waste from landfill. People on mass want to "do the right thing", yet municipal program directors and building superintendents know that odour, fruit flies as well as unwelcomed animals with health concerns are a deterrent for full participation in organics diversion.

Green Bin Deodorizer targets all of these issues. This all-natural product from Green Leaf Distribution Inc. neutralizes the green bin odours and prevents fruit flies in just a few shakes. It contains a strong deterrent for animals thus the problems regarding rodents such as raccoons are eliminated in one easy and clean step.

The Green Bin Deodorizer is formulated with the world's highest purity type of clinoptilolite zeolite (volcanic mineral) and black pepper derivatives. This powerful mixture instantly goes to work when applied to decomposing food waste. It electrically attracts the molecules of the offending odours and gases (ammonia, hydrogen sulfide and methane) and traps them safely and effectively inside its crystalline structure. This rigid three-dimensional structure has a high specific surface area, allowing the mixture to perform double duty by absorbing wet food waste moisture.
